AI Bot Improvement Suggestions

Login & Registration :

1. The account registration system is functioning properly. However, Google authentication is not implemented effectively. Currently, users can register using any random Gmail address without proper verification, as there is no OTP or email validation in place.
   - It is recommended to implement secure authentication methods such as Google OAuth or email-based OTP verification to ensure only valid users can register.

Dark Mode :

1. The dark mode feature is not functioning properly. When dark mode is enabled, the text and UI elements do not adjust accordingly, resulting in poor visibility and readability.
2. Additionally, dark mode is not consistently maintained across navigation. When users move to another page, the theme may not apply correctly, and upon returning, dark mode is automatically disabled.
   - It is recommended to ensure proper theme styling across all components and persist user preferences using local storage or global state management.

Callender Section :

1. In the calendar section, the search and create buttons are not functioning as expected. Users are unable to perform search operations or create new events using these controls.
   - It is recommended to fix button functionality and ensure proper event handling.

Task Section :

1. In the task section, the “New List” page overlaps with the “All Tasks” page, causing a cluttered and confusing interface.
   - It is recommended to fix layout and routing issues so that each page displays independently.

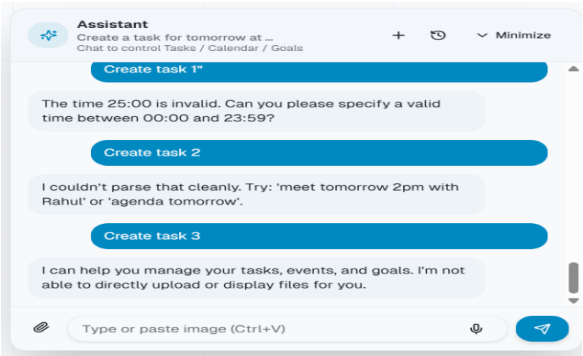
Upload Section:

1. In the upload section, files and images are successfully uploaded, but they are not displayed after the upload is completed.
   - It is recommended to implement proper preview or feedback mechanisms so users can confirm successful uploads.

Chatbot :

1. The chatbot takes to much time to respond after a task creation request is submitted, resulting in a delayed user experience.
2. Uploading files through the chatbot takes a significant amount of time, leading to a slow and frustrating user experience.
3. At times, when a new or unrelated query is asked, the chatbot repeats responses from previous questions instead of addressing the current input.

AI Bot Improvement Suggestions



4. When a command like “Add a meeting on Monday with high priority” is given, the chatbot confirms that the event has been created successfully. However, the created meeting is not visible anywhere in the calendar or task list.
5. When random or meaningless inputs such as “?????” or “asdjkh askdhj task create” are entered, the chatbot still proceeds to create a task instead of recognizing the input as invalid.
6. This indicates a lack of proper input validation and intent detection. It is recommended to improve validation logic so that unclear or nonsensical inputs are rejected, and appropriate error or clarification messages are provided to the user.
